AND PETER WILLEMÉ (EDS)**

ENEPRI RESEARCH REPORT NO. 117A

(COMPANION DOCUMENT TO ENEPRI RESEARCH REPORT NO. 117)

DECEMBER 2012

Abstract

This document provides statistical appendices underpinning the research presented in ENEPRI Research Report No. 117, “Performance of Long-Term Care Systems in Europe”, December 2012.

ENEPRI Research Reports present the findings and conclusions of research undertaken in the context of research projects carried out by a consortium of ENEPRI member institutes. This report is a contribution to Work Package 7 of the ANCIEN project, which focuses on the future of long-term care for the elderly in Europe, funded by the European Commission under the 7th Framework Programme (FP 7 Health-2007-3.2.2, Grant no. 223483). The views expressed are attributable only to the authors in a personal capacity and not to any institution with which they are associated. The results and conclusions of this paper are those of the authors and are not attributable to Eurostat, the European Commission or any of the national authorities whose data have been used.

Appendix B. Probabilities of receiving help for characteristic older persons

Because of the high number of interactions in the model for receiving help, the estimation results are not so easy to interpret and presenting the average marginal effects of different variables is more informative. Another way to present the results is to show the probability of getting help for persons with certain characteristics who could be needing help in different countries. In that case, of course, the selected characteristics also have an important impact on the results. In doing this, we have to take into account that not just the impact of certain characteristics, but also the characteristics themselves can differ among countries. For example, it is possible that fewer people live alone in southern European countries than in western European countries. In that case the resulting probabilities for persons living alone are more relevant for western than for southern European countries. To show the additional effect of different background characteristics, we calculate the probability of getting help for each country for three types of elderly. These types are characteristic for a certain part of Europe. Table B1 shows the characteristics of a typical older person with limitations in the west, south and east of Europe.¹

Table B1. Characteristic persons with limitations in different parts of Europe

	West	South	East
Age	80-85	80-85	80-85
Education	middle	low	low
Income (€1000s, standardised)	20	11	6
Gender	woman	woman	woman
Urban	large town	large town	small town
Children	yes	yes	yes
Grandchild(ren)	yes	yes	yes
Living alone	yes	no	yes
iADL limitations as most severe lim.	no	yes	no
1 ADL limitation as most severe lim.	yes	no	yes
Number of mobility lim.	3	3	4
Number of symptoms	3	2	4
Cognition	middle quintile	worst quintile	worst quintile
Depression	no	no	yes
Number of chronic disorders	3	2	2
More intensive contact with children	no	no	yes

We have chosen to set the age in all parts of Europe at the category ‘between 80 and 85 years old’, an age at which many people can be expected to need some help.² As most older people with limitations in this age group are women, our typical elders are also women. The typical woman in the south of Europe is relatively healthy: she has no ADL-limitations, fewer symptoms and fewer chronic disorders. The typical woman in eastern Europe is relatively unhealthy: she has 1 ADL-limitation

¹ These characteristics are based on country-specific means for the relevant persons in the SHARE database, where special attention has been paid to means for representative countries in ANCIEN. For example, the mean for Poland played a larger role than the mean for the Czech Republic in constructing the typical person in eastern Europe.

² This means that our typical elderly are not typical for the whole group of persons who are 65 years or older.

(perhaps in addition to iADL-limitations), she suffers from depression and she has more mobility limitations and symptoms. The typical educational level is lower in the south and east, as is the income. The typical woman in the south of Europe lives with others, the other typical women (west and east) live alone. Cognitive functioning is on average better in the west.³

Table B2 shows the probability of getting help for each of the three types of older people in different countries. The first column shows that the probability of receiving help for a typical western European older woman with limitations is highest in Switzerland (85%) and lowest in Poland (25%). However, in Poland characteristics and circumstances will be different, affecting the probability of help. The probability of receiving help is much higher in Poland for a person with “Polish characteristics” instead of western European characteristics, at 44%. However, when we take differences in characteristics into account, the probability of receiving help is still only about half of the probability in Switzerland. In the last column, the probabilities by country are determined by the characteristics that are most typical for that country (the column is a combination of the first three columns). Also in this case the probability of help is highest in Switzerland, followed by the Netherlands, the Czech Republic, Austria and Belgium. The lowest probability of help is found in Poland, Italy and Greece. The probability of help is more or less in-between in Denmark and Spain. The rather low probability for Denmark is somewhat surprising.

Table B2. Probability of getting help for typical older persons with limitations (in %), by part of Europe

	West	South	East	type specific
Austria	77	77	92	77
Belgium	77	84	85	77
Czech Republic	63	92	79	79
Denmark	57	88	74	57
France	72	83	80	72
Germany	71	n.a.	n.a.	71
Greece	31	51	33	51
Italy	41	45	57	45
Netherlands	80	85	86	80
Poland	25	64	44	44
Spain	40	61	56	61
Sweden	68	88	75	68
Switzerland	85	87	87	85

³ Perhaps because persons with dementia have a larger probability of being admitted into residential care in the west.

Log likelihood	-10255.4					-2981.8	-3149.4
Sample size	3087					3087	3087

The symbols *, ** and *** indicate that a variable is significant at respectively the 5%, 1%, and 0.1% level. To compare the size of the coefficients of the ordered probit model with vignettes (column I) and the standard ordered probit model (column VI), you have to multiply the coefficients from the standard ordered probit model with σ (the final coefficient in column I). The coefficients in the ordered probit models measure the impact on the latent life satisfaction LS_i^* (they do not have a quantitative interpretation). A positive coefficient means that the latent life satisfaction increases if the variable increases.
